About

Video To Link is a video to link converter that turns uploaded files into shareable URLs in seconds. It is built for quick sharing without software installs, and it keeps the original quality of supported uploads. You can use it free without signing up for files up to 100MB, or sign in with Google to keep links permanently and manage a larger video library.

What is Video To Link

Video To Link is a web-based video to URL converter that turns uploaded media into a link you can paste anywhere. It is designed for fast file sharing, with the upload itself

The service emphasizes simple sharing over editing. Based on the site copy, it supports video files such as MP4, MOV, WebM, MKV, and M4V, and it also references image-to-link use on the landing page. The main output is a short videotolink.net address that opens a clean player page and can generate a preview card when shared in chats, documents, emails, or posts.

Key features

- Free video to link conversion for uploads up to 100MB without an account.
- No sign-up required for basic use, so you can create a shareable video link immediately.
- Google sign-in is available if you want links to stay permanently and need a video library.
- Supported upload formats listed on the site include MP4, MOV, WebM, MKV, and M4V.
- Original quality is preserved; the service says it does not re-encode or compress files.
- The link is generated during upload, with no waiting queue described in the workflow.
- Shared links can be pasted into chats, emails, documents, and social posts.
- The product description mentions optional password protection, expiry, and analytics, although those controls are not detailed in the scraped how-to section.

How to use it

- Open the uploader on the Video To Link website.
- Drag and drop a file, or click to browse and select one from your device.
- Upload a supported file type such as MP4, MOV, WebM, MKV, or M4V.
- Wait for the upload to finish; the site says the link appears right away.
- Copy the generated videotolink.net URL and share it wherever you need it.
- If you want permanent links and a library, sign in with Google before or after uploading.

A practical workflow is to use it as a lightweight media hosting tool when you need a

Who it is for

Video To Link is useful for people who need a simple file sharing tool for video assets or preview clips.

- Creators who want to send a rough cut, sample, or final export without zipping files.
- Teams sharing clips in chats or project threads where a clickable link is easier than an attachment.
- People who need a temporary or permanent hosting link for a supported video file.
- Users who prefer a browser-based uploader instead of desktop conversion software.
- Anyone who wants a no-account option for small files and a Google login path for longer-term storage.

It is especially relevant when the recipient needs a playable page rather than a download-only attachment. The preview-card behavior also makes it suitable for places where link unfurling matters.

What to know before you use it

Video To Link has a few clear limits that matter if you are choosing a sharing destination. The free path is capped at 100MB per upload, so larger files will require an account-based workflow or a different tool. The site copy says sign-in keeps links permanently, which means anonymous uploads should be treated as less durable.

There are also some boundaries around what the app does not appear to do. The scraped material does not show timeline editing, trimming, transcoding controls, batch processing, or password/expiry settings in the step-by-step flow, even though those features are mentioned in the top-level description. If you need the exact availability or configuration details for those options, check the live app before relying on them.

Because the service is centered on shareable URLs, it is not the right source for official archival needs, compliance workflows, or master-file preservation. If you need guaranteed retention, platform policies, or legal proof of the original upload, keep your own copy and use the official file source alongside the link service.

The app also states that it preserves original quality and does not re-encode files, but that claim is tied to the service itself rather than a broader media standard. For

stricter controls, verify the settings in the app and use the original repository or storage system as the authoritative record.

In short, this video to link converter is best for fast sharing of supported files when a browser link is more useful than an attachment, while official storage should remain the source of truth for anything long-lived or high-stakes.

FAQ

Is Video To Link free to use?

Which file types does it support?

Does it keep the original video quality?

Can I keep my links permanently?
